

A • Composition law: the HARDEST (lowest-recov) member predicts the mix
 min $r=-0.87$ • joint $r=-0.85$ • mean $r=-0.81$

B • KI schedule: hard KI ($\tau=1$) OVER-INSULATES a low-recov aux (hurts)

Mini V-L-A, RT-1/fractal, SUBN=4000, 3 seeds, 12 mixes. (A) each mix's generalization is best predicted by its MINIMUM-recoverability member ($r=-0.87$) $\rightarrow$ one hard question rescues a shortcut-laden mix. (B) with a low-recov aux, always-joint / late-release help, but hard KI starves the action head (worse than BC-only).
